Yüksek Lisans: Mersin Üniversitesi Bilgisayar Mühendisliği, 2010-2012

Doktora: Çukurova Üniversitesi Bilgisayar Mühendisliği, 2012-2016

CSE214 – Analysis of Algorithms

Lecture 1

Introduction to Analysis of Algorithms

*Based on Cevdet Aykanat's and Mustafa Ozdal's Lecture
Notes - Bilkent*

Logaritma Nedir? Logaritma Formülleri Özellikleri

Logaritma Tanımı: $a, b \in \mathbb{R}^+$ ve $a \neq 1$ olmak üzere $a^x = b$ denklemini sağlayan x sayısına $\log_a b$ denir ve b 'nin a tabanında logaritması diye okunur.

1) $\log_a x = b$ ise $x = a^b$ $\log_2 8 = 3 \mid 8 = 2^3$

2) $\log_a (A \cdot B) = \log_a A + \log_a B$ $\log_2 (4 \cdot 8) = \log_2 (32) = 5 = \log_2 (4) + \log_2 (8) = 2 + 3$

3) $\log_a (A/B) = \log_a A - \log_a B$ $\log_2 (16/4) = \log_2 (4) = 2 = \log_2 (16) - \log_2 (4) = 4 - 2 = 2$

4) $\log_a A^n = n \cdot \log_a A$ $\log_2 8^2 = \log_2 64 = 6 = 2 \cdot \log_2 8 = 2 \cdot 3 = 6$

5) $\log_{a^m} A^n = \frac{n}{m} \log_a A$ $\log_{2^3} 8^2 = \log_8 64 = 2 = (2/3) \cdot \log_2 8 = 2/3 \cdot 3 = 2$

6) $\log (a^n) x = \frac{1}{n} \cdot \log_a x$ $\log_{2^3} 8 = \log_8 8 = 1 = (1/3) \cdot \log_2 8 = 1/3 \cdot 3 = 1$

7) $\log_a x = (\log_b x) / (\log_b a)$ [taban değiştirme] $\log_4 16 = 2 = \log_2 16 - \log_2 4 = 4 - 2 = 2$

8) $a^{\log_a x} = x$ $2^{\log_2 8} = 2^3 = 8 = 8$

9) $\log_a \sqrt[n]{A} = \frac{1}{n} \log_a A$ $\log_2 \sqrt[3]{8} = \log_2 2 = 1 = \left(\frac{1}{3}\right) \cdot \log_2 8 = \frac{1}{3} \cdot 3 = 1$

10) $\log_{1/a} x = -\log_a x$

$$\log_{1/2} 8 = -\log_2 8 = -3 \mid 8 = \left(\frac{1}{2}\right)^{-3}$$

11) $\log_a b \cdot \log_b c \cdot \log_c d = \log_a d$ $\log_2 4 \cdot \log_4 16 \cdot \log_{16} 256 = 2 \cdot 2 \cdot 2 = 8 = \log_2 256$

12) $\log_a b = 1/\log_b a$ veya $\log_a b \cdot \log_b a = 1$

Algorithm Definition

- Algorithm: A sequence of computational steps that transform the input to the desired output
- Procedure vs. algorithm
 - An algorithm ***must halt within finite time*** with the right output meanwhile procedure may not halt
- Example:

Many Real World Applications

- ❑ **Bioinformatics**
 - ❑ Determine/compare DNA sequences
 - ❑ **Internet**
 - ❑ Manage/manipulate/route data
 - ❑ **Information retrieval**
 - ❑ Search and access information in large data
 - ❑ **Security**
 - ❑ Encode & decode personal/financial/confidential data
 - ❑ **Electronic design automation**
 - ❑ Minimize human effort in chip-design process
-

Course Objectives

- Learn basic algorithms
 - Gain skills to design new algorithms
 - Focus on efficient algorithms
 - Design algorithms that
 - are fast
 - use as little memory as possible
 - are correct!
-

Outline of Lecture 1

- Study two sorting algorithms as examples
 - Insertion sort: *Incremental* algorithm
 - Merge sort: *Divide-and-conquer*
 - Introduction to runtime analysis
 - Best vs. worst vs. average case
 - Asymptotic analysis
-

Sorting Problem

Input: Sequence of numbers

$$\langle a_1, a_2, \dots, a_n \rangle$$

Output: A sorted list

$$\Pi = \langle \Pi(1), \Pi(2), \dots, \Pi(n) \rangle$$

such that

$$a_{\Pi(1)} \leq a_{\Pi(2)} \leq \dots \leq a_{\Pi(n)}$$

Insertion Sort

Insertion sort is an incremental algorithm

An incremental algorithm is given a sequence of input, and finds a sequence of solutions that build incrementally while adapting to the changes in the input

Incremental computation, is a software feature which, whenever a piece of data changes, attempts to save time by only recomputing those outputs which depend on the changed data

Insertion Sort: Basic Idea

- Assume input array: $A[1..n]$
- Iterate j from 2 to n

Pseudo-code notation

- ❑ Objective: Express algorithms to humans in a clear and concise way
 - ❑ Liberal use of English
 - ❑ Indentation for block structures
 - ❑ Omission of error handling and other details
 → *needed in real programs*
-

Algorithm: Insertion Sort

Insertion-Sort (A)

1. **for** $j \leftarrow 2$ **to** n **do**
 2. $\text{key} \leftarrow A[j];$
 3. $i \leftarrow j - 1;$
 4. **while** $i > 0$ **and** $A[i] > \text{key}$
 do
 5. $A[i+1] \leftarrow A[i];$
 6. $i \leftarrow i - 1;$
 - endwhile**
 7. $A[i+1] \leftarrow \text{key};$
 - endfor**
-

Algorithm: Insertion Sort

Insertion-Sort (A)

```
1. for  $j \leftarrow 2$  to  $n$  do
2.    $\text{key} \leftarrow A[j];$ 
3.    $i \leftarrow j - 1;$ 
4.   while  $i > 0$  and  $A[i] > \text{key}$ 
      do
5.      $A[i+1] \leftarrow A[i];$ 
6.      $i \leftarrow i - 1;$ 
      endwhile
7.    $A[i+1] \leftarrow \text{key};$ 
   endfor
```

} Iterate over array

Loop invariant:

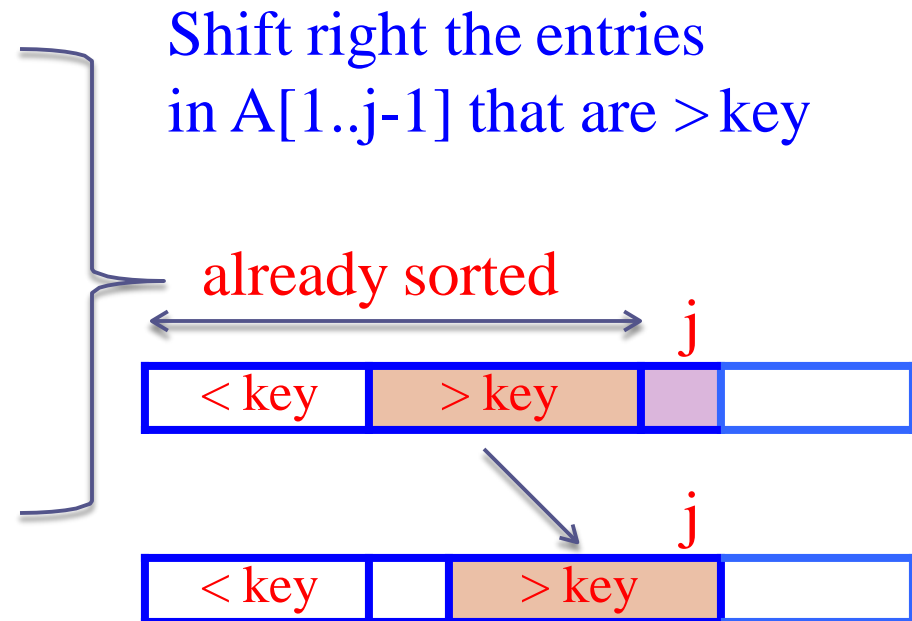

The subarray $A[1..j-1]$
is always sorted

Algorithm: Insertion Sort

Insertion-Sort (A)

```
1. for  $j \leftarrow 2$  to  $n$  do
2.    $\text{key} \leftarrow A[j]$ ;
3.    $i \leftarrow j - 1$ ;
4.   while  $i > 0$  and  $A[i] > \text{key}$ 
      do
5.      $A[i+1] \leftarrow A[i]$ ;
6.      $i \leftarrow i - 1$ ;
      endwhile
7.    $A[i+1] \leftarrow \text{key}$ ;
endfor
```

Algorithm: Insertion Sort

Insertion-Sort (A)

```
1. for  $j \leftarrow 2$  to  $n$  do
2.    $\text{key} \leftarrow A[j]$ ;
3.    $i \leftarrow j - 1$ ;
4.   while  $i > 0$  and  $A[i] > \text{key}$ 
       do
5.      $A[i+1] \leftarrow A[i]$ ;
6.      $i \leftarrow i - 1$ ;
       endwhile
7.    $A[i+1] \leftarrow \text{key}$ ;
   endfor
```

} Insert key to the correct location
End of iter j : $A[1..j]$ is sorted

Insertion Sort - Example

Insertion-Sort (A)

```
1. for  $j \leftarrow 2$  to  $n$  do  
2.    $\text{key} \leftarrow A[j];$   
3.    $i \leftarrow j - 1;$   
4.   while  $i > 0$  and  $A[i] > \text{key}$   
      do  
5.      $A[i+1] \leftarrow A[i];$   
6.      $i \leftarrow i - 1;$   
      endwhile  
7.    $A[i+1] \leftarrow \text{key};$   
   endfor
```

5	2	4	6	1	3
---	---	---	---	---	---

Insertion Sort - Example: Iteration $j=2$

Insertion-Sort (A)

1. **for** $j \leftarrow 2$ **to** n **do**
2. $\text{key} \leftarrow A[j];$
3. $i \leftarrow j - 1;$
4. **while** $i > 0$ **and** $A[i] > \text{key}$
 do
5. $A[i+1] \leftarrow A[i];$
6. $i \leftarrow i - 1;$
- endwhile**
7. $A[i+1] \leftarrow \text{key};$
- endfor**

Insertion Sort - Example: Iteration $j=3$

Insertion-Sort (A)

1. **for** $j \leftarrow 2$ **to** n **do**
2. $\text{key} \leftarrow A[j];$
3. $i \leftarrow j - 1;$
4. **while** $i > 0$ **and** $A[i] > \text{key}$
 do
5. $A[i+1] \leftarrow A[i];$
6. $i \leftarrow i - 1;$
- endwhile**
7. $A[i+1] \leftarrow \text{key};$
- endfor**

What are the entries at the end of iteration $j=3$?

Insertion Sort - Example: Iteration $j=3$

Insertion-Sort (A)

1. **for** $j \leftarrow 2$ **to** n **do**
2. $\text{key} \leftarrow A[j];$
3. $i \leftarrow j - 1;$
4. **while** $i > 0$ **and** $A[i] > \text{key}$ **do**
5. $A[i+1] \leftarrow A[i];$
6. $i \leftarrow i - 1;$
7. **endwhile**
8. $A[i+1] \leftarrow \text{key};$
9. **endfor**

Insertion Sort - Example: Iteration $j=4$

Insertion-Sort (A)

1. **for** $j \leftarrow 2$ **to** n **do**
2. $\text{key} \leftarrow A[j]$;
3. $i \leftarrow j - 1$;
4. **while** $i > 0$ **and** $A[i] > \text{key}$
 do
5. $A[i+1] \leftarrow A[i]$;
6. $i \leftarrow i - 1$;
- endwhile**
7. $A[i+1] \leftarrow \text{key}$;
- endfor**

Insertion Sort - Example: Iteration $j=5$

Insertion-Sort (A)

1. **for** $j \leftarrow 2$ **to** n **do**
2. $\text{key} \leftarrow A[j];$
3. $i \leftarrow j - 1;$
4. **while** $i > 0$ **and** $A[i] > \text{key}$
 do
5. $A[i+1] \leftarrow A[i];$
6. $i \leftarrow i - 1;$
- endwhile**
7. $A[i+1] \leftarrow \text{key};$
- endfor**

What are the entries at the end of iteration $j=5$?

Insertion Sort - Example: Iteration $j=5$

Insertion-Sort (A)

1. **for** $j \leftarrow 2$ **to** n **do**
2. $\text{key} \leftarrow A[j]$;
3. $i \leftarrow j - 1$;
4. **while** $i > 0$ **and** $A[i] > \text{key}$
 do
5. $A[i+1] \leftarrow A[i]$;
6. $i \leftarrow i - 1$;
- endwhile**
7. $A[i+1] \leftarrow \text{key}$;
- endfor**

Insertion Sort - Example: Iteration $j=6$

Insertion-Sort (A)

1. **for** $j \leftarrow 2$ **to** n **do**
2. $\text{key} \leftarrow A[j];$
3. $i \leftarrow j - 1;$
4. **while** $i > 0$ **and** $A[i] > \text{key}$
 do
5. $A[i+1] \leftarrow A[i];$
6. $i \leftarrow i - 1;$
- endwhile**
7. $A[i+1] \leftarrow \text{key};$
- endfor**

Insertion Sort Algorithm - Notes

- Items sorted **in-place**
 - Elements rearranged within array
 - At most constant number of items stored outside the array at any time (e.g. the variable *key*)
 - Input array A contains sorted output sequence when the algorithm ends
 - **Incremental** approach
 - Having sorted $A[1..j-1]$, place $A[j]$ correctly so that $A[1..j]$ is sorted
-

Running Time

- Depends on:
 - **Input size** (e.g., 6 elements vs 6,000,000 elements)
 - **Input itself** (e.g., partially sorted)
 - Usually want *upper bound*
-

Kinds of running time analysis

- Worst Case (*Usually*)

$T(n)$ = max time on any input of size n

- Average Case (*Sometimes*)

$T(n)$ = average time over all inputs of size n

Assumes statistical distribution of inputs

- Best Case (*Rarely*)

$T(n)$ = min time on any input of size n

BAD*: Cheat with slow algorithm that works fast on some inputs

GOOD: Only for showing bad lower bound

*Can modify any algorithm (almost) to have a low best-case running time

➤ Check whether input constitutes an output at the very beginning of the algorithm

Running Time

- For Insertion-Sort, what is its **worst-case** time?
 - Depends on speed of primitive operations
 - **Relative speed** (on same machine)
 - **Absolute speed** (on different machines)

 - **Asymptotic analysis**
 - Ignore machine-dependent constants
 - Look at **growth** of $T(n)$ as $n \rightarrow \infty$
-

Θ Notation

- Drop low order terms
- Ignore leading constants

e.g.

$$2n^2 + 5n + 3 = \Theta(n^2)$$

$$3n^3 + 90n^2 - 2n + 5 = \Theta(n^3)$$

- *Formal explanations in the next lecture.*
-

- As n gets large, a $\Theta(n^2)$ algorithm runs faster than a $\Theta(n^3)$ algorithm

Insertion Sort – Runtime Analysis

Cost

Insertion-Sort (A)

c_1	-----	1. for $j \leftarrow 2$ to n do
c_2	-----	2. $\text{key} \leftarrow A[j];$
c_3	-----	3. $i \leftarrow j - 1;$
c_4	-----	4. while $i \geq 0$ and $A[i] > \text{key}$
		do
c_5	-----	5. $A[i+1] \leftarrow A[i];$
c_6	-----	6. $i \leftarrow i - 1;$
		endwhile
c_7	-----	7. $A[i+1] \leftarrow \text{key};$
		endfor

t_j : The number of
times while loop
test is executed for j

How many times is each line executed?

times

Insertion-Sort (A)

n	-----	1. for j ← 2 to n do
n-1	-----	2. key ← A[j];
n-1	-----	3. i ← j - 1;
k ₄	-----	4. while i ≥ 0 and A[i] > key
		do
k ₅	-----	5. A[i+1] ← A[i];
k ₆	-----	6. i ← i - 1;
		endwhile
n-1	-----	7. A[i+1] ← key;
		endfor

$$k_4 = \sum_{j=2}^n t_j$$

$$k_5 = \sum_{j=2}^n (t_j - 1)$$

$$k_6 = \sum_{j=2}^n (t_j - 1)$$

Insertion Sort – Runtime Analysis

- Sum up costs:

$$T(n) = c_1n + c_2(n-1) + c_3(n-1) + c_4 \sum_{j=2}^n t_j + \\ c_5 \sum_{j=2}^n (t_j - 1) + c_6 \sum_{j=2}^n (t_j - 1) + c_7(n-1)$$

- What is the **best case** runtime?
 - What is the **worst case** runtime?
-

Question: If $A[1..j]$ is already sorted, $t_j = ?$

Insertion-Sort (A)

1. **for** $j \leftarrow 2$ **to** n **do**
2. $\text{key} \leftarrow A[j];$
3. $i \leftarrow j - 1;$
4. **while** $i \geq 0$ **and** $A[i] > \text{key}$ **do**
5. $A[i+1] \leftarrow A[i];$
6. $i \leftarrow i - 1;$
7. **endwhile**
8. $A[i+1] \leftarrow \text{key};$
9. **endfor**

$$t_j = 1$$

Insertion Sort – Best Case Runtime

- Original function:

$$T(n) = c_1n + c_2(n-1) + c_3(n-1) + c_4 \sum_{j=2}^n t_j + c_5 \sum_{j=2}^n (t_j - 1) + c_6 \sum_{j=2}^n (t_j - 1) + c_7(n-1)$$

- Best-case: Input array is **already sorted**

$$t_j = 1 \text{ for all } j$$

$$T(n) = (c_1 + c_2 + c_3 + c_4 + c_7)n - (c_2 + c_3 + c_4 + c_7)$$

Q: If $A[j]$ is smaller than every entry in $A[1..j-1]$, $t_j = ?$

Insertion-Sort (A)

1. **for** $j \leftarrow 2$ **to** n **do**
2. $\text{key} \leftarrow A[j];$
3. $i \leftarrow j - 1;$
4. **while** $i \geq 0$ **and** $A[i] > \text{key}$ **do**
5. $A[i+1] \leftarrow A[i];$
6. $i \leftarrow i - 1;$
- endwhile**
7. $A[i+1] \leftarrow \text{key};$
- endfor**

$$t_j = j$$

Insertion Sort – Worst Case Runtime

- Worst case: The input array is reverse sorted

$$t_j = j \text{ for all } j$$

- After derivation, worst case runtime:

$$T(n) = \frac{1}{2}(c_4 + c_5 + c_6)n^2 + (c_1 + c_2 + c_3 + \frac{1}{2}(c_4 - c_5 - c_6) + c_7)n - (c_2 + c_3 + c_4 + c_7)$$

$$1 + 2 + 3 + \dots + n = \frac{n \cdot (n + 1)}{2}$$

Asymptotic Notation

This will be explained in further lessons

Just for now, it simply means that how our algorithm's run time grows as the number of inputs grows to the infinity

Insertion Sort – Asymptotic Runtime Analysis

Insertion-Sort (A)

```
1. for j  $\leftarrow$  2 to n do  
2.   key  $\leftarrow$  A[j];  
3.   i  $\leftarrow$  j - 1;  
4.   while i  $\geq$  0 and A[i] > key  
      do  
5.     A[i+1]  $\leftarrow$  A[i];  
6.     i  $\leftarrow$  i - 1;  
      endwhile  
7.   A[i+1]  $\leftarrow$  key;  
   endfor
```

$\Theta(1)$

$\Theta(1)$

$\Theta(1)$

Asymptotic Runtime Analysis of Insertion-Sort

- **Worst-case** (input reverse sorted)

- Inner loop is $\Theta(j)$

$$T(n) = \sum_{j=2}^n \Theta(j) = \Theta\left(\sum_{j=2}^n j\right) = \Theta(n^2)$$

- **Average case** (all permutations equally likely)

- Inner loop is $\Theta(j/2)$

$$T(n) = \sum_n \Theta(j/2) = \sum_n \Theta(j) = \Theta(n^2)$$

- Often, average case not much better than worst case
 - Is this a fast sorting algorithm?
 - Yes, for small n . No, for large n .
-

Merge Sort

Merge Sort is a divide and conquer type algorithm

Divide and Conquer basically works in three steps:

1. **Divide** - It first divides the problem into small chunks or sub-problems
 2. **Conquer** - It then solve those sub-problems recursively so as to obtain a separate result for each sub-problem
 3. **Combine** - It then combine the results of those sub-problems to arrive at a final result of the main problem
-

Merge Sort: Basic Idea

Merge-Sort (A, p, r)

if $p = r$ **then return;**

else

$q \leftarrow \lfloor (p+r)/2 \rfloor;$

(Divide)

Merge-Sort (A, p, q);

(Conquer)

Merge-Sort (A, q+1, r);

(Conquer)

Merge (A, p, q, r);

(Combine)

endif

- Call Merge-Sort(A, 1, n) to sort A[1..n]
 - Recursion bottoms out when subsequences have length 1
-

Merge Sort: Example

Merge-Sort (A, p, r)

if p = r then

→ return

else

$q \leftarrow \lfloor (p+r)/2 \rfloor$

Merge-Sort (A, p, q)

Merge-Sort (A, q+1, r)

Merge(A, p, q, r)

endif

How to merge 2 sorted subarrays?

□ What is the complexity of this step?

$\Theta(n)$

Merge Sort: Complexity

Merge-Sort (A, p, r)

$T(n)$

if $p = r$ **then**

return

$\Theta(1)$

else

$q \leftarrow \lfloor (p+r)/2 \rfloor$

$\Theta(1)$

Merge-Sort (A, p, q)

$T(n/2)$

Merge-Sort (A, q+1, r)

$T(n/2)$

Merge(A, p, q, r)

$\Theta(n)$

endif

Merge Sort – Recurrence

- Describe a function recursively in terms of itself
- To analyze the performance of recursive algorithms
- For merge sort:

$$T(n) = \begin{cases} \Theta(1) & \text{if } n=1 \\ 2T(n/2) + \Theta(n) & \text{otherwise} \end{cases}$$

How to solve for $T(n)$?

$$T(n) = \begin{cases} \Theta(1) & \text{if } n=1 \\ 2T(n/2) + \Theta(n) & \text{otherwise} \end{cases}$$

□ Generally, we will assume $T(n) = \Theta(1)$ for sufficiently small n

□ The recurrence above can be rewritten as:

$$T(n) = 2 T(n/2) + \Theta(n)$$

□ How to solve this recurrence?

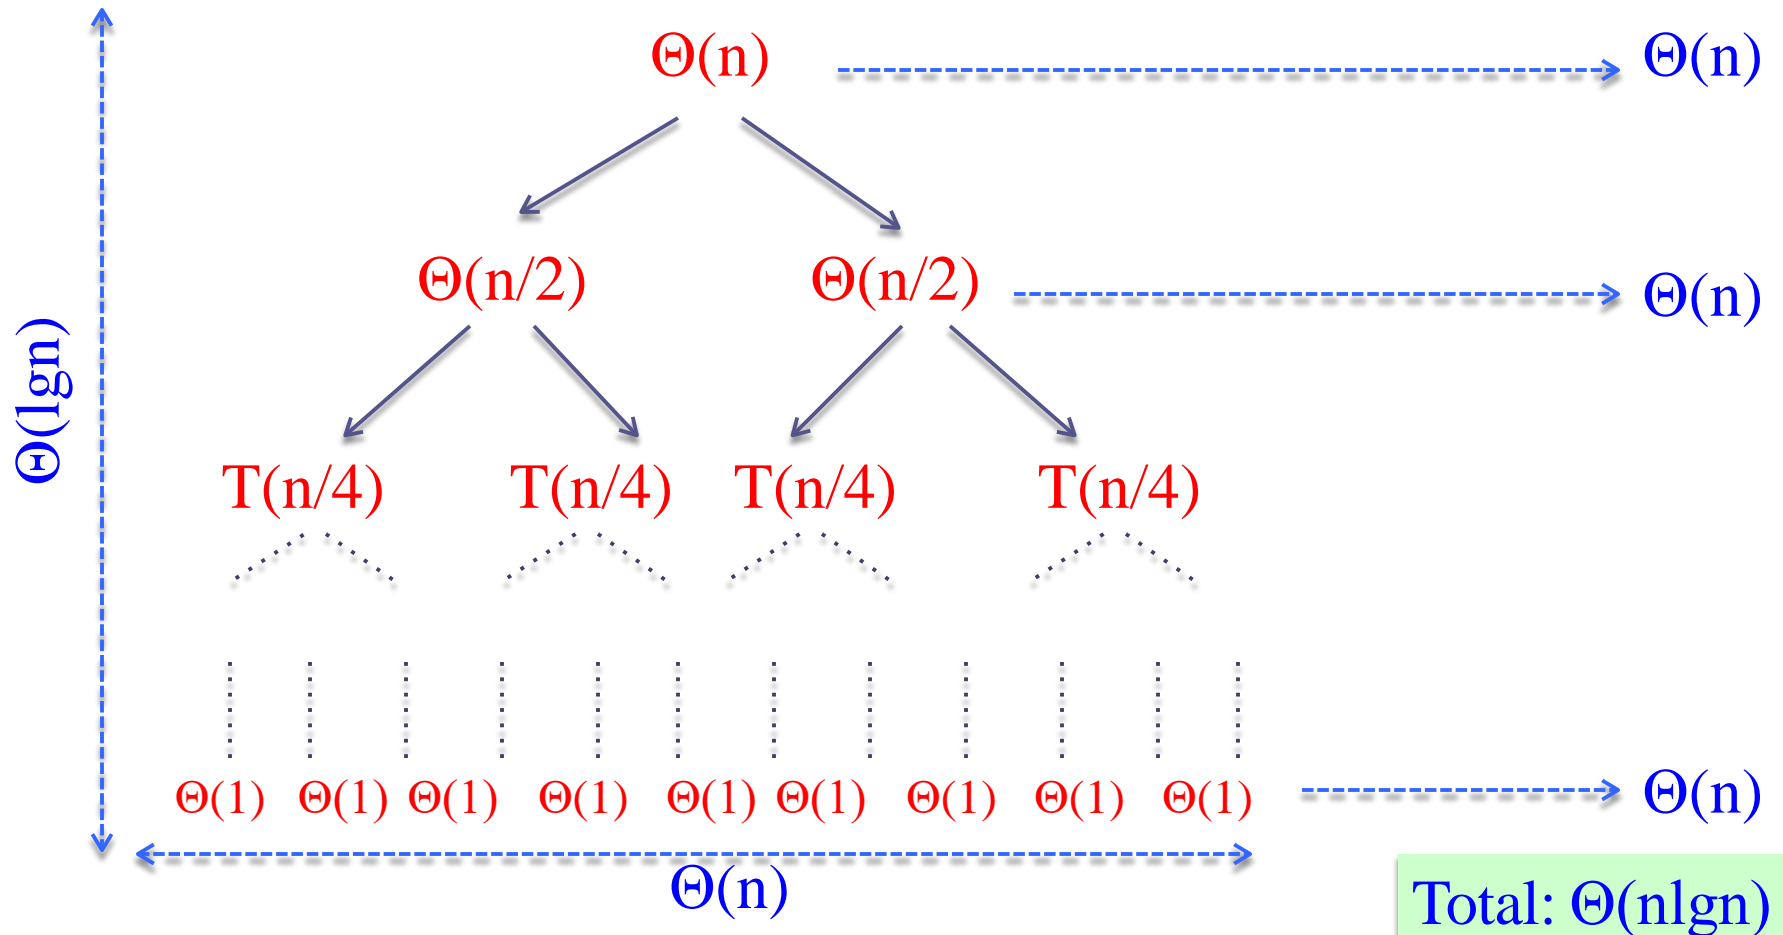

Solve Recurrence: $T(n) = 2T(n/2) + \Theta(n)$

Solve Recurrence: $T(n) = 2T(n/2) + \Theta(n)$

Solve Recurrence: $T(n) = 2T(n/2) + \Theta(n)$

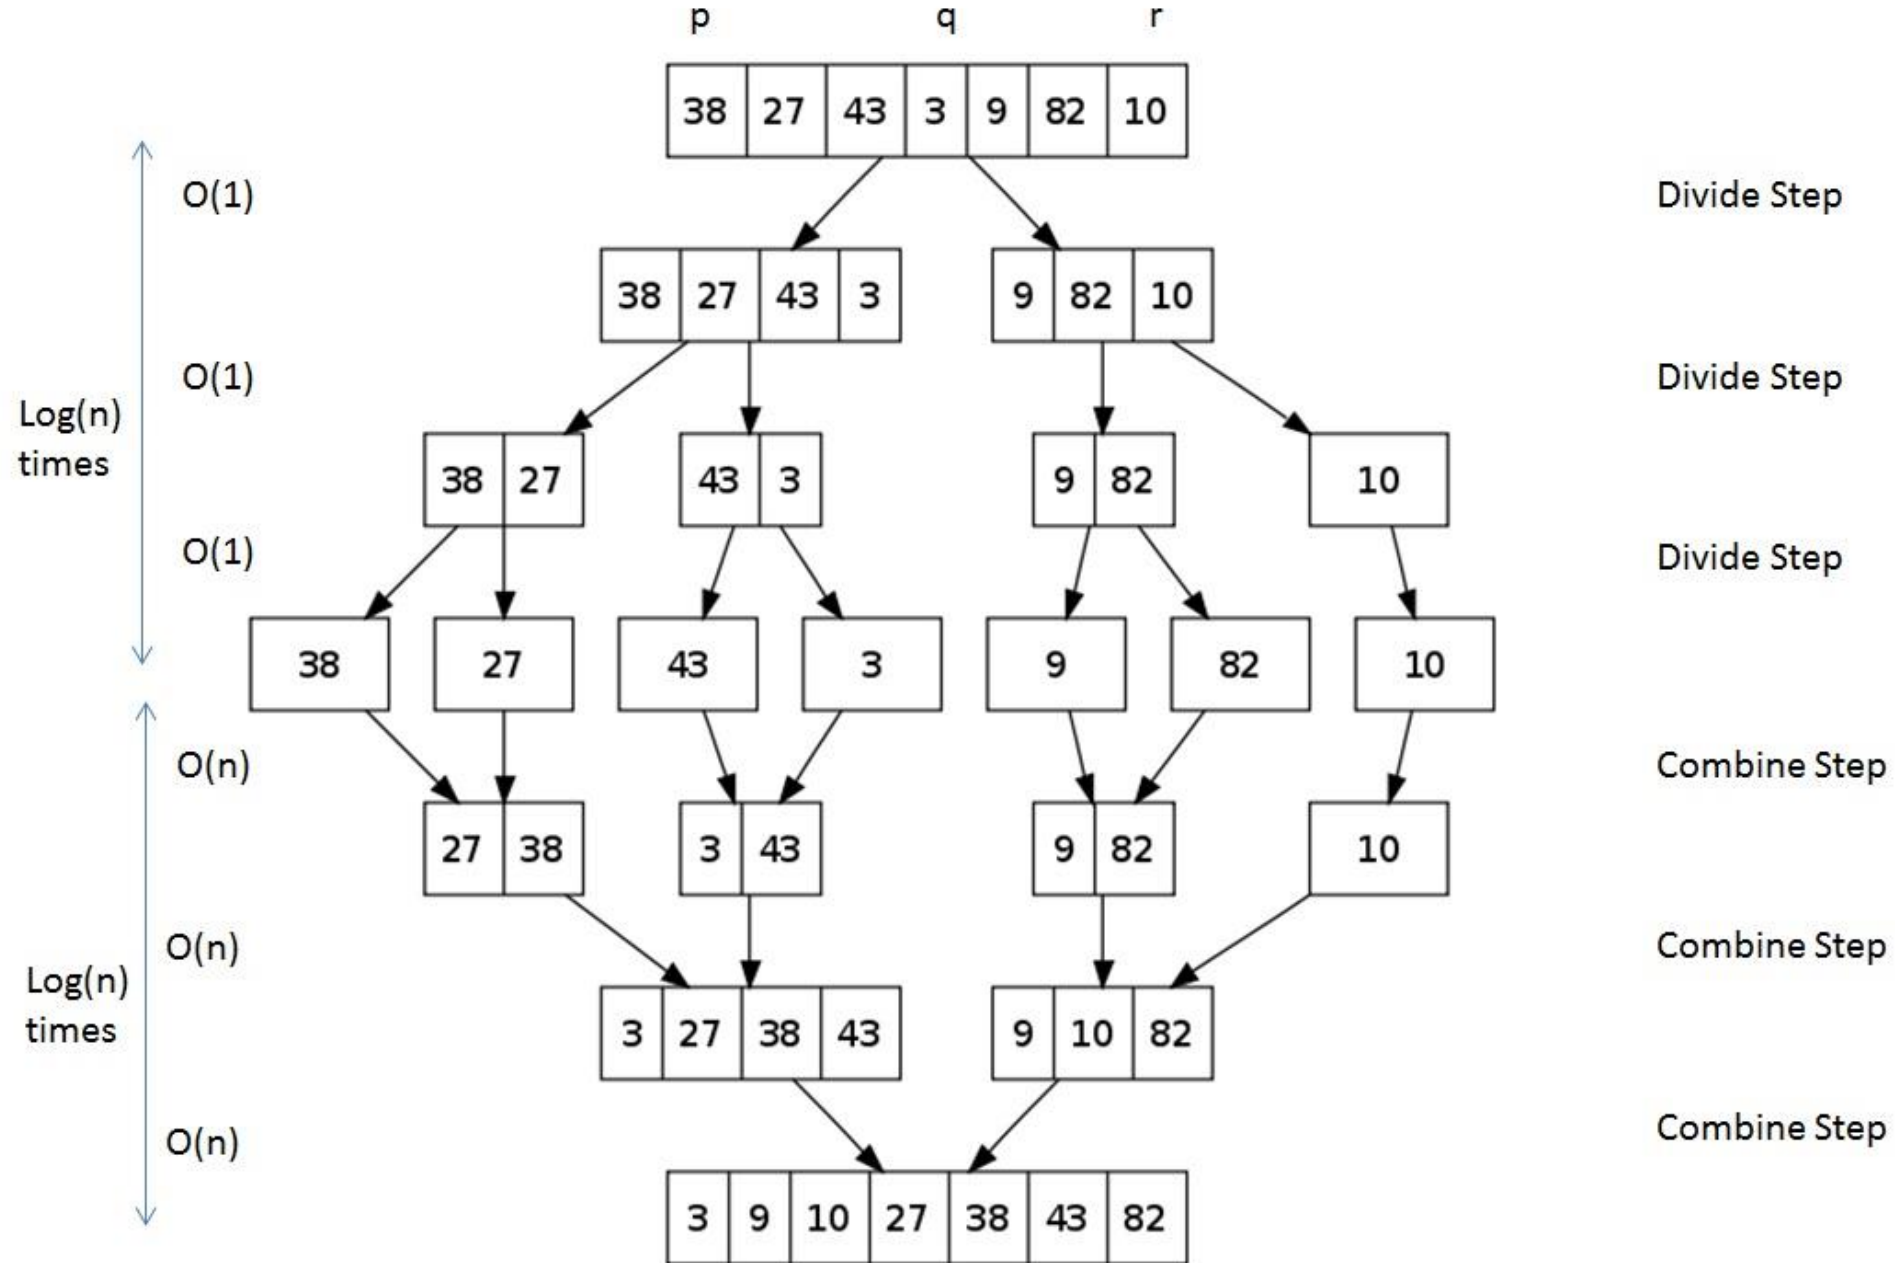

Merge Sort Complexity

- Recurrence:

$$T(n) = 2T(n/2) + \Theta(n)$$

- Solution to recurrence:

$$T(n) = \Theta(n \lg n)$$

Total Runtime = Total time required in Divide + Total time required in Combine
 $= 1 * \log(n) + n * \log(n) = n \log(n).$

Conclusions: Insertion Sort vs. Merge Sort

- $\Theta(n \lg n)$ grows more slowly than $\Theta(n^2)$
 - *E.g. $n=1,000 > \text{Merge sort} = 1000 * \log(1000) = 9,965$
/ $\text{Insertion Sort} = 1000 * 1000 = 1,000,000$*
 - Therefore Merge-Sort beats Insertion-Sort in the worst case
 - In practice, Merge-Sort beats Insertion-Sort for $n > 30$ or so.
-

Project Work 1 : 10 points

Code merge sort and insertion sort in any programming language

Generate 100,000 random integers between 1 and 2,000,000,000

Put those integers into an array or list

Sort this list both with insertion sort and merge sort algorithms

Calculate the exact time requirement for each sorting algorithm

Project Work 1 : 10 points

Only calculate the algorithm running part's run time

Do sorting at least 5 times and take average run time to calculate each algorithms more precise run time

Print average running times to the screen

While running, the software should print at which stage the algorithm is

Project Work 1 : 10 points

The software you have coded will be checked and evaluated at the next week's (12.03.2018) lesson on your computer

So bring the program and your laptop to the next lesson

Also please RAR(Winrar) or ZIP(Winzip) your software project and email to furkangozukara@gmail.com with including your full name and your student number
